## Q) factorial

↳ Given  $n$ , Print factorial of  $n$ .

Quiz 1:  $\text{fact}(4) = 1 * 2 * 3 * 4 = 24$

$$\text{fact}(n) = 1 * 2 * 3 * \dots * n$$

```
main() {
```

```
    Scanner sc = new Scanner(System.in);
```

```
    int n = sc.nextInt();
```

```
    int ans = 1;
```

```
    for (int i = 1; i <= n; i++) {
```

```
        ans = ans * i;
```

$n$  iterations ←

```
    }
```

```
    S.op(ans);
```

```
}
```

n=4

ans=1 n=4 4

```
int ans = 1;
for (int i = 1; i <= n; i++) {
    ans = ans * i;
}
```

i	i <= n	ans = ans * i	n = n * i
1	T	ans = 1	<del>n = 4</del>
2	T	ans = 2	<del>n = 8</del>
3	T	ans = 6

$$\frac{{}^nC_r}{{}^nP_r} = \frac{1}{r!}$$

$$\text{Quiz 2: } {}^5C_3 = \frac{n!}{r!(n-r)!} = \frac{5!}{3!2!} = \frac{120}{12} = 10$$

$$\text{Quiz 3: } {}^5P_3 = \frac{n!}{(n-r)!} = \frac{5!}{2!} = \frac{120}{2} = 60$$

AlgoPrep

Q) Given  $n$  and  $\sigma$ , write an algorithm to calculate  $n_c$ .

$$\frac{Ln}{Ln - \sigma}$$

main C) ↵

```
Scanner scn = new Scanner(System.in);
```

```
int n = scn.nextInt();
```

```
int σ = scn.nextInt();
```

```
int ans1 = 1; → Ln
```

```
for (int i = 1; i ≤ n; i++) {
```

```
    ans1 = ans1 * i;
```

```
}
```

```
int ans2 = 1; → Ln
```

```
for (int i = 1; i ≤ σ; i++) {
```

```
    ans2 = ans2 * i;
```

```
}
```

```
int ans3 = 1; → Ln - σ
```

```
for (int i = 1; i ≤ n - σ; i++) {
```

```
    ans3 = ans3 * i;
```

```
}
```

```
int ans = ans1 / (ans2 * ans3);
```

```
S.o.p(ans);
```

DRY: Donot repeat yourself.

Syntax:

```
public static int name(input){
```

```
// Statement 1
```

```
;  
;  
;  
}
```

}

// "static void main" must be defined in a public class.

```
public class Main {  
    public static void main(String[] args) {  
        int temp = add(10, 20, 30); 60  
        System.out.println(temp);  
    }  
}
```

```
public static int add(int a, int b, int c){  
    return a+b+c;  
}
```

```
}
```

```
}
```

main C) {

Scanner sc = new Scanner(System.in);

int n = sc.nextInt();  $\rightarrow 5$

int s = sc.nextInt();  $\rightarrow 3$

int ans1 = fact(5);  $120 \rightarrow 6$

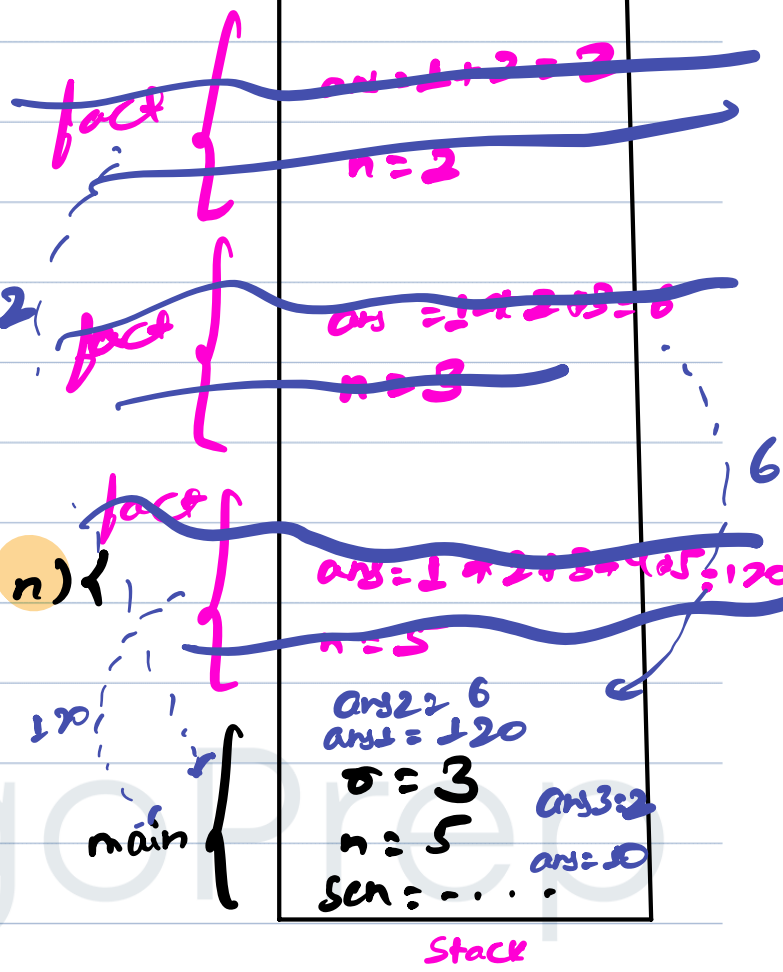

int ans2 = fact(6);  $720 \rightarrow 6$

int ans3 = fact(2);  $2 \rightarrow 2$

int ans = ans1 / (ans2 \* ans3);  $2$

$\rightarrow$  S.O.P(ans);

$\rightarrow 10$

Public static int fact (int n) {

int ans = 1;

for (int i = 1; i <= n; i++) {

ans = ans \* i;

return ans;

}

main {

ans2 = 6

ans1 = 120

s = 3

n = 5

sc = ...

ans3 = 2

ans = 10

Stack

→ you can have no output of a function. In that case return type should be void.

### Quiz 4:

```
Public Static void main (String [] args) {  
    Product (5,10); 50  
}
```

```
Public Static int Product (int a, int b) {  
    return a*b;  
}
```

↳ NO output

### Quiz 5:

```
Public Static void main (String [] args) {  
    → int ans = Subtract (5,10);  
    System.out.println (ans);  
}
```

```
Public Static void errorSubtract (int 5a, int 10b) {  
    return a - b;  
}
```

## Quiz 6:

```
public static void main (String [] args) {
```

```
    int n1 = cube(3);
```

```
    → System.out.println (add(n1, cube(2))); → 35
```

```
}
```

```
public static int add (int a, int b) {  
    return a + b;
```

```
}
```

```
public static int cube (int a) {  
    return a * a * a;
```

```
}
```
